

# Heritage - Coal & Pebble Inset Decorative Gas Fire

---

## Installation and Users Instructions

**This product is not suitable for primary heating purposes**

These instructions should be read by the installer before installation and then should be handed to the end user when the installation is complete.

**This is an official requirement and is the responsibility of the fitter of this appliance.**

Having installed the appliance, the installer should take the necessary steps to ensure that the user fully understands how to operate the appliance and is also made aware of the fire's basic cleaning and maintenance requirements.

### THIS APPLIANCE IS INTENDED FOR DECORATIVE PURPOSES

This appliance has been designed, tested and manufactured to the European Standard EN509 relating to Decorative Gas Appliances and **must** be installed by a qualified GAS SAFE Registered Installer in accordance with the Gas Safety (Installation and use) regulations 1994 and all other relevant standards.

This appliance must be connected in accordance with the National Regulations. The appliance must be sealed into a non-combustible fireplace (Fig. 2) whose only opening must be through a Class I (7" or 175mm diameter) or Class II (5" or 125mm diameter) chimney / flue of at least three metres in height.

Before installation, ensure that the local conditions, (identification of gas type and pressure) and the adjustment of the appliance are compatible.

An air vent is not normally required for this application because its input does not exceed 7kW. We recommend that the chimney/flue is swept prior to installation of this appliance and that any flue restrictor or damper plate should be removed or fixed in the open position. The chimney/flue must always generate a positive up draught to ensure safe operation.

The installer must then establish that all the products of combustion are entering the flue within five minutes of lighting from cold. This can be verified by traversing the canopy with a lighted smoke match (see 'Spillage Test' page 4).

An isolation valve must be fitted adjacent to the appliance. When closed, this will allow the complete burner and control assembly to be disconnected for maintenance or repair in accordance with national regulations.

The gas supply should be provided by a semi rigid pipe with an 8mm diameter and should be no longer than 1.5 metres in length.

**NOTE:** When the gas supply pipe is passed through masonry or other brickwork always ensure that the end of the pipe is covered to avoid any debris passing through into the appliance controls. The appliance is fitted with an Oxygen Depletion Sensor (ODS) that monitors the room for products of combustion. If products are detected, the ODS will automatically shut down the appliance. If this situation arises, re-light the appliance, referring to the user instructions (page 8). If shut down re-occurs, a qualified person must be called to thoroughly check the appliance. The spillage monitoring system (ODS pilot) must not be put out of operation or be tampered with or adjusted by either the installer or the user. If the unit is found to be at fault it should be replaced with the manufacturers original replacement parts.

Heritage is a free standing gas burner tray suitable for fitting in a British Standard clay chair brick, or in a ceramic fibre hot box (available from Legend Fires).

Heritage is also approved for use in a chimney that has a Class 2 cowl or flexible flue liner, providing it is a standard 22"x16" opening.

**This appliance must only be installed in Great Britain or Ireland.**

1. This fire is either a natural gas or LPG appliance and has been designed for use with the following applications:

a) **Class I** - Conventional brick or stone chimney as used for a solid fuel fire with a cross sectional dimension of 225mm x 225mm (9" x 9") or a lined flue with a minimum diameter of 175mm (7"), with the fireplace components conforming to BS1251, or a builders opening a minimum of 550mm high and 400mm wide with a minimum depth of 230mm to allow sufficient volume for debris collection. To obtain this depth it would not normally be necessary to remove the chair brick. Any permanent flue restrictions or variable dampers are to be removed or locked in the fully open position. The chimney should also be swept prior to installation.

b) **Class II** - A double walled or insulated metal flue box built to the requirements of BS715 with an insulated flue having a minimum diameter of 125mm (5") and a minimum effective overall height of 3 metres (10').

**NOTE:** If the flue box is to be used with an existing brick or stone chimney, a 125mm (5") minimum diameter flue liner conforming to BS715 may be used.

2. A non-combustible hearth must be provided to comply with current building regulations. Care should be taken to prevent any damage being caused to surrounding soft furnishings or decoration, e.g. many embossed vinyl wall coverings may become discoloured if placed too close to the appliance.

3. A suitable proprietary fire surround with 100°C rating may be used with a minimum clearance from hearth to underside of shelf of 830mm, providing that the depth of shelf is 150mm or less.

4. Where the shelf depth is greater than 150mm, the minimum height clearance should be increased by 25mm increments for each additional 12.5mm of shelf depth.

5. Minimum width between vertical sides of combustible surround should not be less than 800mm provided the appliance is central to the surround and the surround legs do not exceed a 150mm profile.

6. If the 150mm profile is exceeded, the width of the surround (and the back panel) should be increased by 25mm for each additional 12.5mm of profile depth.

### FLUE FLOW TEST

A flue flow test (smoke test) is carried out to check the effectiveness of the flue and to ensure that there is no leakage into another part of the premises (including any loft), or as appropriate other adjoining premises (this is particularly important where a number of chimneys combine into a multiple stack).

The flue flow test should be carried out using a suitable smoke pellet which the pellet manufacturer claims to generate 5 m<sup>3</sup> of smoke in 30 seconds burn time.

These gas fires should have the flue flow test carried out with the appliance in position but not connected to the gas supply so that the smoke test can be carried out with representative flue flow conditions.

A warm flue will be more effective than a cold flue. If the flue is reluctant to draw, which can be initially assessed by lighting a smoke match at the intended position of the appliance flue connection, introduce some heat into the flue for a minimum of 10 minutes using a blow torch or other means.

Other factors, such as weather conditions and a combination of materials used to construct the flue can all influence the flue draught. The pre-heating process may require as much as half an hour before the flue behaves satisfactory as a blow torch does not represent the volume of heat consistent with the normal appliance operation.

A Flue Flow Test should be checked as follows:

1. Carry out those visual checks as indicated previously, and continue only if satisfactory.
2. Establish that an adequate air supply is available for the combustion of the appliance
3. Close all doors and windows in the room that the appliance is to be installed.
4. Light a smoke pellet at the intended position for the appliance. Place the inset fire case into position.
5. The test is satisfactory if
  - there is no significant escape of smoke from the appliance position.
  - there is no seepage of smoke over the length of the flue.
  - smoke is discharged only from the correct terminal.

### VENTILATION

No special ventilation bricks or vents are required in the room containing the appliance, providing that normal adventitious room ventilation exists. The installer must determine this by carrying out a spillage test.

### SPILLAGE TEST

To check for satisfactory clearance of products of combustion, close all doors and windows and leave the fire burning for five minutes. Insert a lit smoke match on a vertical plane 50mm down, 50mm inside the canopy opening. All the smoke must be drawn into the flue. If spillage occurs, allow a further ten minutes and repeat the test. Should spillage still occur turn the appliance off and seek expert advice.

To continue the test: If an extractor fan is situated in the room the test should be repeated with the fan running. If there is a connecting room with an extractor fan the test should be repeated with all the doors to that room open and the extractor fan running.

## INSTALLATION PROCEDURE

1. Carefully lift the appliance out of the packaging taking care not to damage the ceramic components in the separate carton.
2. Unwrap the burner unit and remove the data label and the two self tapping screws positioned at the base of the control knob securing the floor mounting bracket. Place the burner to one side (Fig. 2).
3. Position the floor mounting bracket squarely in the fireplace opening ensuring that it is level and central. Once level and central, fix the floor mounting bracket in place with rawl plugs and suitable screws.
4. Trial fit the burner onto the floor mounting bracket and take measurements to shape and cut an 8mm semi rigid gas supply pipe.
5. Once the supply pipe has been cut and shaped correctly, secure the burner unit onto the floor mounting bracket with the two self tapping screws previously removed.

Fig. 2

6. Connect the gas supply ensuring the use of the isolation valve supplied and check the pipe work and connections for leaks using leak detection fluid.
7. Re-fix the data label back onto the appliance.
8. Please see installation diagrams (page 10-11) to set the fuel bed, front coal and loose coals onto the appliance, then fit a suitable fire front of not less than 44 square centimetres, minimum free area. (the ash pan cover air inlet area should be approximately 2 inlets x12cm long x 2cm high).

## COMMISSIONING

1. Connect a suitable gas pressure gauge to the inlet pressure test point and light the fire in accordance with the user instructions (page 8). Turn the fire to the higher setting and consult the technical data (page 6) for the cold inlet burner pressure.
2. Having established that the appliance pressure is correct carry out a full spillage test (page 4).
3. The installer must hand over all the instructions to the user and should explain the operation of the burner (page 8) and the cleaning and maintenance of the appliance. (page 9).
4. The user should also be informed that the appliance requires servicing every twelve months by a qualified GAS SAFE Registered Engineer.

Fig. 3

Gas Type	Natural Gas (G20) Cat I <sub>2</sub> H	LPG (G31) Cat I <sub>3</sub> P
Gas Connection	8mm	8mm
Number of Injectors	One	One
Injector size	Stereomatic 074	Stereomatic 110
Control Max Operating Temperature	80°C	80°C
Inlet Pressure Cold	20 mbar (8" W.G.)	37 mbar
Heat Input (Gross)	6.9 kW	5.1 kW
Weight	7.5 kg	7.5 kg

## REPLACEMENT PARTS

1. **Loose coals** - The ceramic coals supplied with this appliance can be replaced at service intervals depending on their condition. If the coals do require replacement, the consumer can do so provided that the Ceramic Component Layout Instructions (pages 10-11) are adhered to. Under no circumstances should additional/extra coals be added. Only genuine Legend replacement parts should be used.

Order Ref: **HLC04**

2. **Front Coal and Fuel Bed** - All these ceramic components can be replaced at service intervals depending on their condition. If the coals do require replacement, the consumer can do so provided that the Ceramic Component Layout Instructions (pages 10-11) are adhered to. Only genuine Legend replacement parts should be used.

Order Ref: **HFC02, HCM03,**

3. **Oxygen Depletion Sensing Pilot** - In the unlikely event of a pilot failure, the pilot assembly should only be replaced by a **GAS SAFE Registered Engineer**. The user must not carry out this work.

Order Ref: **NG: LEG01, LPG: LEG26**

4. **Control Tap** - In the unlikely event of control tap failure, the assembly should only be replaced by a **GAS SAFE Registered Engineer**. The user must not carry out this work.

Order Ref: **NG: LEG02, LPG: LEG30**

### 1. The Piezo will not spark.

Check: If the electrode is cracked or broken - Replace pilot assembly.  
If the HT lead is shorting out on the burner body - Locate where the short is occurring, isolate and/or re-route the lead.  
If the HT unit/lead is faulty - Replace as necessary.

### 2. The Pilot will not light (but the Piezo is sparking).

Check: If the gas is reaching the pilot - check joints and connections.  
If the pilot jet is blocked - Inspect and clean.  
If the pilot is still not passing gas - Replace the pilot assembly.

### 3. The Pilot lights but goes out when the control knob is released.

Check: If the Thermocouple is loose/disconnected at the control valve - remake the connection.  
If the Thermocouple is faulty - Replace.  
If the Electro magnetic valve is faulty - replace valve.

### 4. The Burner will not light readily from the pilot.

Check: If the coals are obstructing the pilot to burner path ie. Are the coals blocking the opportunity for the pilot to light the burner - Relay the coal set as per Ceramic Component Layout Instructions. (pages 11-14).

### 5. The fire makes a roaring noise when lit.

Check: That the front coal is seated correctly and the pilot hole is positioned correctly over the pilot assembly.

**IF ANY PART OF THE PILOT ASSEMBLY IS SUSPECTED AS BEING FAULTY THE COMPONENT MUST BE REPLACED.**

### 6. The flames appear blue (after the fire has fully warmed up). The coals/ceramic liners have soot deposits.

Check: That the coals have not moved from the original setting - Relay the coals as per the Ceramic Component Layout Instructions (pages 10-11).  
There may be too little/much ventilation into the room. Identify and then take steps to rectify.

### 7. The flame picture is low on the high setting.

Check: For any partial blockages - Check all obvious locations for debris in pipe work and fittings.  
Inlet gas pressure, both standing and working gas pressure - Identify problem and take necessary steps to rectify. **Note:** Flame pattern improves with use.

### 8. Fumes enter the room when the fire is operating.

Check: Why the chimney is not drawing all the products of combustion up the flue, identify where the problem lies and rectify, otherwise disconnect the fire and seek professional guidance.

**THIS APPLIANCE IS INTENDED FOR DECORATIVE PURPOSES.**

Please also familiarise yourself with the **Notes for the Installer and End User** on page 3.

## OPERATION AND CONTROLS

It is most important that the operator of this gas appliance has fully read and understood all the operating, cleaning and maintenance procedures as laid out in these instructions.

**Fig. 4**

### Lighting Procedure

1. To light the fire, remove the ash pan cover.
2. Control knob to be in POSITION 1 at commencement of the ignition sequence.
3. Fully depress control knob and turn anticlockwise to POSITION 2 where it reaches a natural restriction (allow a couple of seconds for the pilot gas to purge through the pipe). A sparking click is heard/felt and the pilot flame is then lit (the fire can safely be left on permanent pilot at this stage for future lighting if preferred or can be ignited every time the fire is lit). The pilot assembly is located at the front lefthand side of the fire, and when ignited (this can take two or three 'clicks') it can be seen through the front coal set. Keep the knob depressed for 10/15 seconds to allow the thermocouple to establish the pilot flame. The knob can then be released.
4. The operating level of the burner is now set by turning the control knob from the pilot POSITION 2 through the maximum setting POSITION 3 to the minimum POSITION 4. The control knob is adjustable between these two positions.
5. To turn off the appliance, depress the control knob and turn clockwise until the POSITION 2 is reached. The main burner will go out but the pilot light will still be lit. The pilot can then be extinguished by depressing the control knob and then turning to the off POSITION 1.

### WARNINGS:

**Never throw any type of rubbish on or otherwise disturb the fuel bed.**

**Any alteration to this appliance including its ceramic components may render it inoperable and unsafe.**

**ALWAYS run this appliance on the high setting for the first 30 minutes (minimum) - Failure to do this may result in poor combustion and excessive sooting.**

## CLEANING AND MAINTENANCE

Legend Gas Fires recommend that this appliance is serviced at regular 12 monthly intervals. The chimney or flue should also be checked regularly to ensure that all products of combustion are entering the flue and there is no excessive build up of soot.

It is the users responsibility to ensure that the appliance is kept in a clean serviceable condition.

1. **Ceramic Components and Fuel Bed** - Debris from any source should be removed with a soft brush. Please ensure that any debris including soot deposits are removed from the appliance and not left on the fuel bed. It is recommended that the user should, on a regular quarterly basis, carefully remove all ceramic components and thoroughly clean the stainless steel burner strip and the pilot assembly. Any build up of debris in this area could affect the operation of the appliance.

Fig. 5

**NOTE:** It is common to find surface cracks in the ceramic components. This is due to the expansion and contraction of the ceramic fibres caused by the intense heat that the burner generates. The cracks will not affect the safe operation of this appliance. However great care must be taken when handling the ceramic components as they will break if handled incorrectly. Do not use a vacuum cleaner to clean the ceramics.

2. **Brass Trims and Frets** - The brass trim and fret should be removed from the appliance for cleaning, please ensure that the appliance has cooled thoroughly. Polished metal trims and frets are not lacquer coated and therefore require polishing. It is recommended that a good quality metal polish is used.

## FIRE FRONT SPECIFICATIONS - HERITAGE INSET ONLY

Fire fronts are now available in many different designs and finishes. The user can now choose their own particular style of fire front to suit their individual fireplace setting, providing the fire front complies with the following dimensions -

Fire Front -	(X) Max: 210mm	Min: 190mm
Ash Pan Cover -	(W) Max: 90mm	Min: 65mm
	(Y) Max: 345mm	Min: 320mm

Fig. 6

**SAFETY WARNING** - This appliance has a naked flame and as with all heating appliances a fireguard should be used for the protection of children, the elderly and infirm. Fireguards should conform to BS 6539 (1984 Fireguards for use with solid fuel appliances). This fire is not fitted with an integral guard. In normal use consideration may be given to the use of a fireguard conforming to BS 6539, such that the approach to the naked flame is minimised.

Fig. 7

Fig. 8

Fig. 9

Fig. 10

**It is very important that all the coals are used and arranged as shown in order to achieve the desired flame picture.**

It may be necessary to remove some or all of the coals to clean them at some time. Cleaning must only be done using a soft brush.

**CAUTION:** The coals are extremely fragile and must be handled accordingly. Gloves should be worn and any inhalation of dust should be avoided. The coals must be kept away from children at all times. Never put additional coals on the fire. Never use coals other than those originally supplied, or genuine Legend Spare Parts.

1. Place the main fuel bed on to the back section of the metal burner tray. It is important that the front edge of the fuel bed is located behind the burner strip (Fig. 8).

2. Position the front coal on the front coal retainer, making sure that the back edge is pushed up against the front of the burner strip (Fig. 9).

3. Lay the first row of six loose coals on top of the front coal, with the back of the coals resting against the fuel bed ensuring even gaps all round (Fig. 10).

Fig. 11

4. Choose five loose coals and place them in line on the next row up, again making sure all the gaps are even. It is important that the coals 'bridge' the peaks of the fuel bed and are not placed in between them (Fig. 11).

5. Place the next four coals randomly on the back edge of the coals previously laid. Make any adjustments necessary to achieve even gaps as this will help in giving a well balanced flame picture and an even red glow (Fig. 12).

Fig. 12

Fig. 13

Fig. 14

Fig. 15

Fig. 16

**It is very important that all the pebbles are used and arranged as shown in order to achieve the desired flame picture.**

It may be necessary to remove some or all of the pebbles to clean them at some time. Cleaning must only be done using a soft brush.

**CAUTION:** The pebbles are extremely fragile and must be handled accordingly. Gloves should be worn and any inhalation of dust should be avoided. The pebbles must be kept away from children at all times. Never put additional pebbles on the fire. Never use pebbles other than those originally supplied, or genuine Legend Spare Parts.

1. Place the main fuel bed on to the back section of the metal burner tray. It is important that the front edge of the fuel bed is located behind the burner strip (Fig. 14).

2. Position the front ceramic on the front ceramic retainer, making sure that the back edge is pushed up against the front of the burner strip (Fig. 15).

3. Lay the first row of six loose pebbles on top of the front ceramic, with the back of the pebbles resting against the fuel bed ensuring even gaps all round (Fig. 16).

Fig. 17

4. Choose five loose pebbles and place them in line on the next row up, again making sure all the gaps are even. It is important that the pebbles 'bridge' the peaks of the fuel bed and are not placed in between them (Fig. 17).

5. Place the next four pebbles randomly on the back edge of the pebbles previously laid. Make any adjustments necessary to achieve even gaps as this will help in giving a well balanced flame picture and an even red glow (Fig. 18).

Fig. 18

## **GUARANTEE**

---

Your appliance is guaranteed for one year from proof of purchase. Should the appliance prove defective within that period we agree to repair or replace (at our discretion) the component or appliance provided that:

1. The user can produce a receipt for proof of purchase/installation.
2. The appliance has been supplied by an authorised stockist and has been installed by a qualified installer, all installation and operating instructions have been strictly adhered to.
3. No alterations have been carried out on the appliance or component parts without our written consent.
4. The appliance has not been used for any purpose other than those intended.
5. The appliance has not been damaged accidentally or due to fair wear and tear.

Guarantee claims should be made through your appliance supplier. The Guarantee is restricted to UK Mainland and is additional to your statutory rights.

## **TROUBLE SHOOTING (USER)**

---

### **1. The Fire will not light.**

Remove the brass fret and check the pilot area for soot.

If soot is present remove all the loose coals and the front coal and thoroughly clean any debris in and around the pilot area.

If the fire will still not light contact your installer.

### **2. The flames appear blue - excessive soot deposits.**

The ceramic components including the coal need relaying (pages 10-11).

Too much or too little room ventilation. Seek professional advice.

### **3. Roaring noise coming from the pilot.**

The front coal is not seated correctly. Turn the appliance off and allow to cool down. Re-seat front coal, ensuring it is flat to the base of the front coal retainer (page 10).

### **4. All the Ceramic Components are discolouring.**

The ceramic sets and liners are all manufactured from ceramic fibre and its natural colour is white, dyes are used to give it a realistic appearance. These dyes discolour after they have been subjected to intense heat. However the discolouration does not affect the operation of the appliance. The realistic appearance can be restored with the use of a good replacement dye that can be purchased from most good fireplace showrooms.
